**Division of  
Cardiology**

# Background

- **Pulmonary hypertension associated with significant morbidity and mortality during pregnancy**
- **Transthoracic echocardiography with Doppler estimated PASP is the usual screening modality**
- **Validity of estimated PASP using TTE has only been rarely assessed**

# Methods

- **Meta-analysis of pregnant patients undergoing both TTE and RHC including 3 UIC patients and 49 measurements from 46 patients in the 3 previous published studies with primary data**
- **We compared accuracy using two different cut-off points:**
  - **any degree of elevated PASP  $\geq 30$  mmHg**
  - **PASP  $\geq 40$  mmHg which correlates with World Health Organization definition pHTN of mean PASP of  $>25$  mmHg.**

# Methods continued

- **PASP estimated via the modified Bernoulli equation: tricuspid regurgitant velocity ( $4V^2$  plus estimated RA pressure)**
- **Classification of pulmonary pressure:**
  - Normal PASP: <30 mm Hg
  - Mild pHTN 30-44 mm Hg
  - Moderate pHTN 45-59 mm Hg
  - Severe pHTN  $\geq 60$  mm Hg

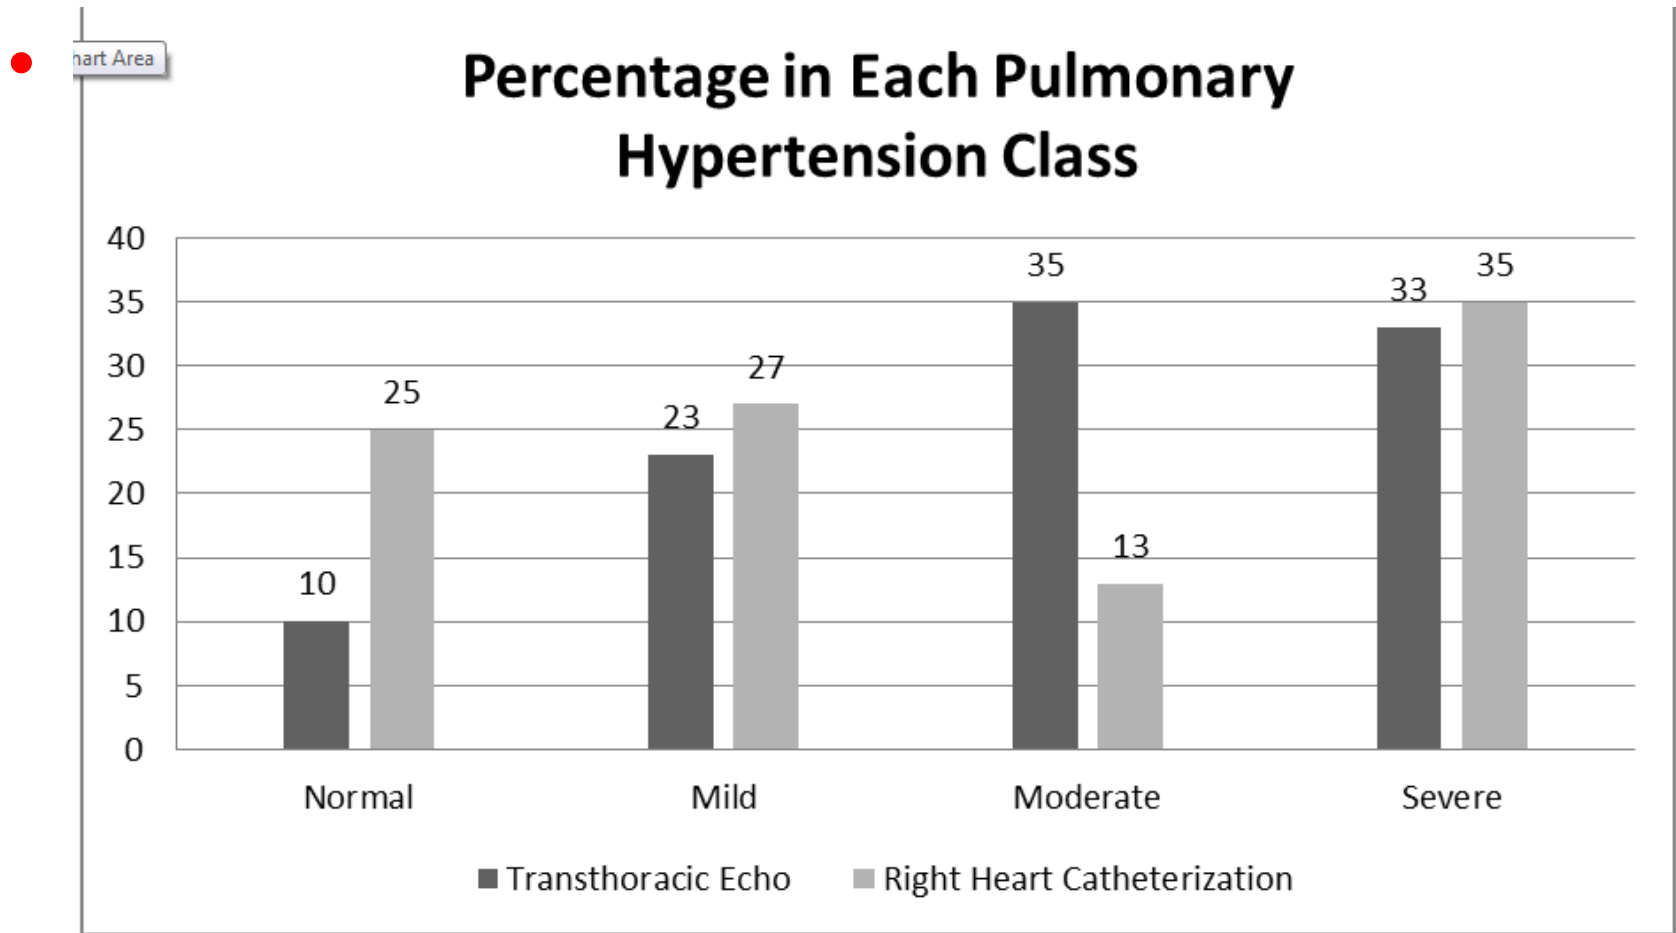

# Findings

- **Mean Age 28.7**

- | <b>Etiology</b>                       | <b>N</b>  | <b>(Percentage)</b> |
|---------------------------------------|-----------|---------------------|
| <b>Congenital</b>                     | <b>20</b> | <b>(41%)</b>        |
| <b>Cardiomyopathy</b>                 | <b>9</b>  | <b>(18%)</b>        |
| <b>Collagen Vascular Disease</b>      | <b>6</b>  | <b>(12%)</b>        |
| <b>Rheumatic HD</b>                   | <b>5</b>  | <b>(10%)</b>        |
| <b>Primary Pulmonary Hypertension</b> | <b>3</b>  | <b>(6%)</b>         |
| <b>Hypertrophic/Hypertensive</b>      | <b>2</b>  | <b>(4%)</b>         |
| <b>NonRheumatic Valvular</b>          | <b>1</b>  | <b>(2%)</b>         |
| <b>Thromboembolic</b>                 | <b>1</b>  | <b>(2%)</b>         |
| <b>Sickle cell disease</b>            | <b>1</b>  | <b>(2%)</b>         |
| <b>Multiple categories</b>            | <b>1</b>  | <b>(2%)</b>         |

# Findings: Percentage of patients in each class by echo and RHC

# Accuracy using 30 mm Hg cut off

	Elevated PASP by RHC	Normal PASP by RHC	Totals
Elevated PASP by Echo	36	11	47
Normal PASP by Echo	3	2	5
Totals	39	13	52

**Sensitivity** 92%  
**Specificity** 15%  
**Positive Predictive Value** 77%  
**Negative Predictive Value** 40%  
**Accuracy** 73%

# Accuracy using 40mm Hg cut off

	Elevated PASP by RHC	Normal PASP by RHC	totals
Elevated PASP by Echo	27	14	41
Normal PASP by Echo	2	9	11
totals	29	23	52

<b>Sensitivity</b>	<b>93%</b>
<b>Specificity</b>	<b>39%</b>
<b>Positive Predictive Value</b>	<b>65%</b>
<b>Negative Predictive Value</b>	<b>82%</b>
<b>Accuracy</b>	<b>69%</b>

# Limitations

- **Selection bias: women with severely elevated pressures more likely to be referred for RHC**
- **Estimation of RA pressure based on older guidelines**
- **RHC and TTE not performed simultaneously in previously published papers**

# Conclusions

- **TTE is a reasonable screening tool for pHTN, although RHC may provide more accurate stratification, especially for women with moderate pHTN.**

**THANK YOU**
