De Soysa Hospital for Women  
Colombo, Sri Lanka

A satellite image of Sri Lanka, showing the island's coastline and surrounding waters. The text 'Sri Lanka' is overlaid in yellow.

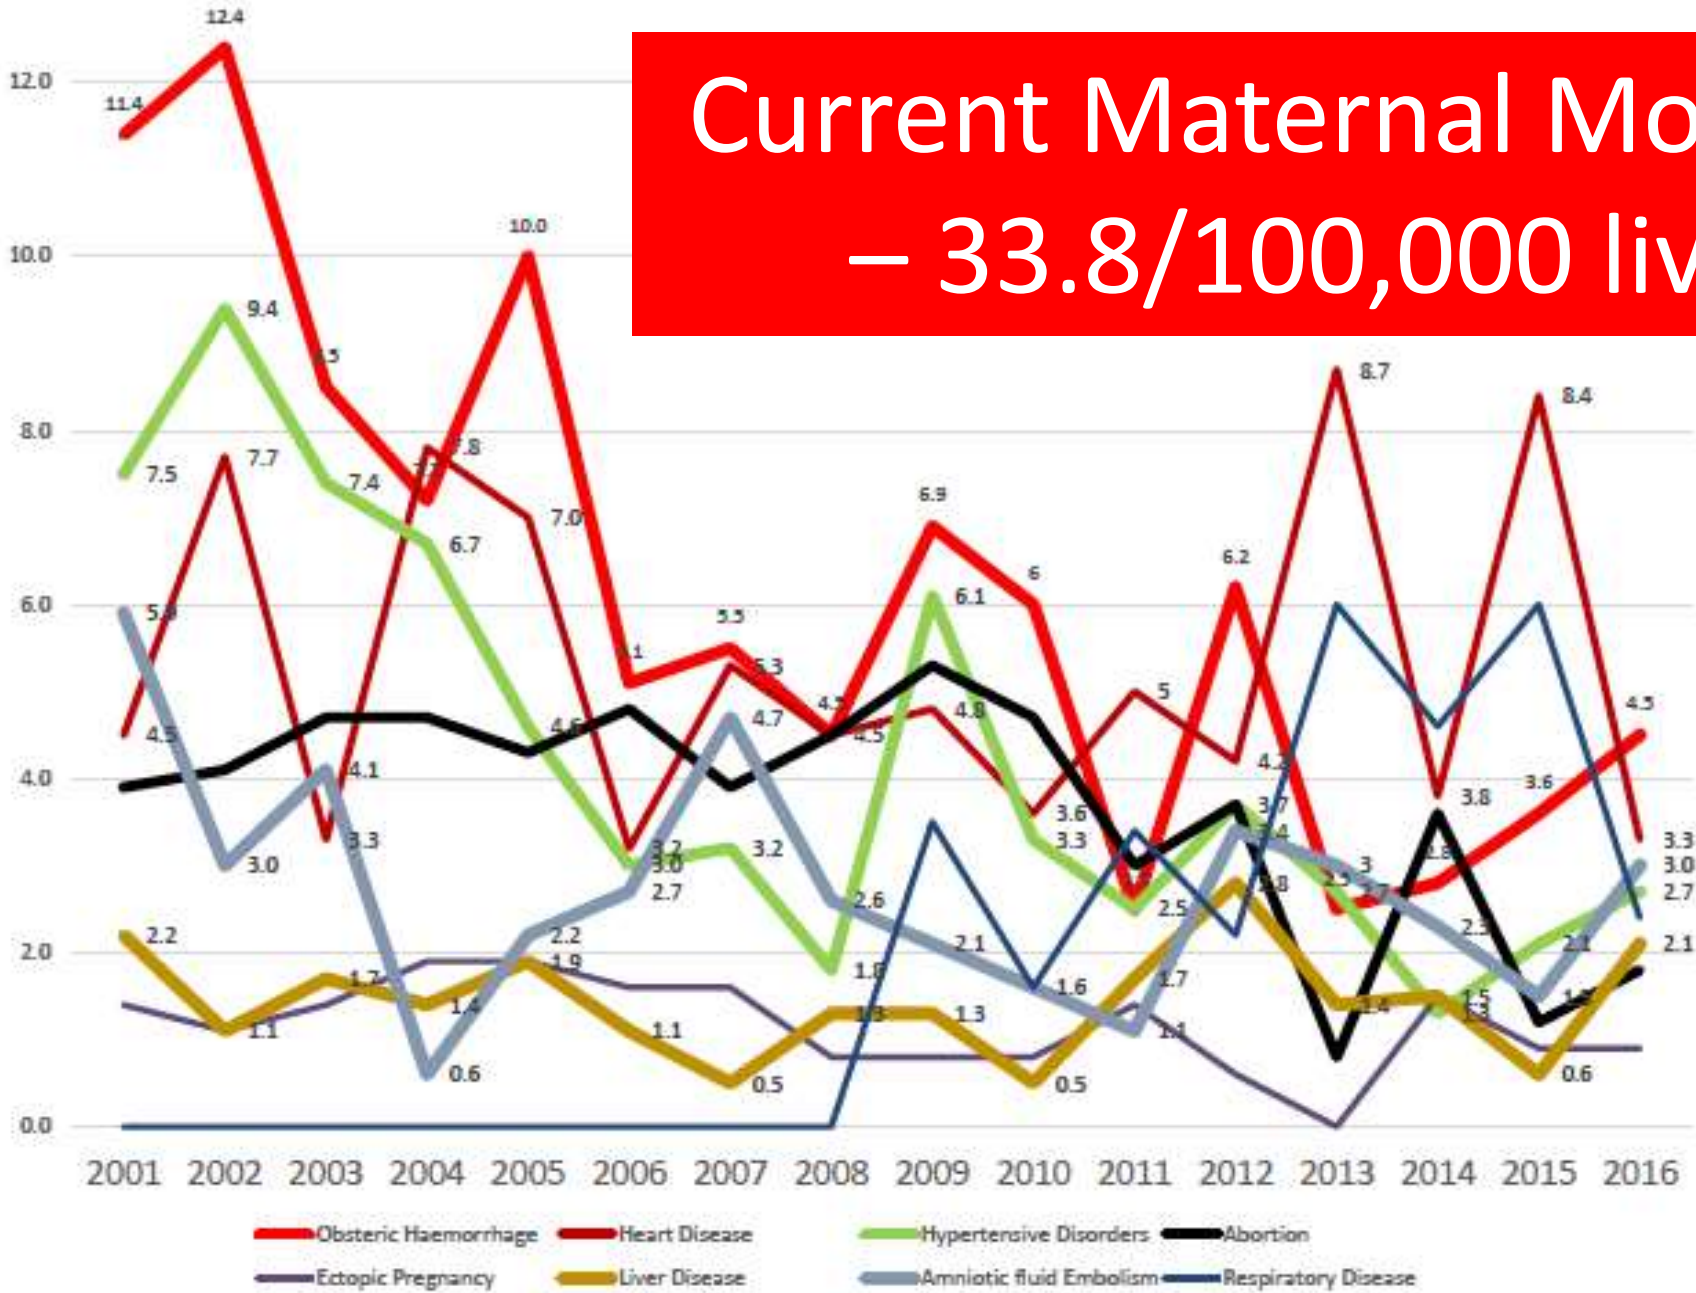

# Sri Lanka

A solid purple rectangular box containing white text.

Population – 20.2 Million  
Per capita GDP = 3760 USD  
Universal free education  
Free healthcare

# Current Maternal Mortality Rate – 33.8/100,000 live births

## Strengths in CPP:

- We are a national referral centre for high risk pregnancies
- A dedicated 'Cardiac Clinic' (30 years) + weekly MDT
- Echocardiography is freely available
- A comprehensive National MM review

## Weaknesses:

- Catheterization studies are unavailable except for interventions
- Only 3 ICU beds are available for the whole hospital (Shared between 4 Units)
- A minority of women conceal the diagnosis for social reasons

# Our management protocol

---

- Kept in ward until delivery (\*Subject to conditions)
- At least two visits to MDT meeting
- Limited exertion
- Thromboprophylaxis
- Weight & NYHA Class assessed daily
- Intermittent or night-time O<sub>2</sub> for severe PH patients

# Mode of delivery

---

We aim for vaginal delivery in an ICU setting

Assisted delivery under epidural

Due to limited availability of ICU beds, induction of labor is resorted to often

**Table 6** Modified WHO classification of maternal cardiovascular risk: principles

Risk class	Risk of pregnancy by medical condition
	No detectable increased risk of maternal mortality and
	Continues, care as for class III.

Total = 113  
Class III – 20  
Class IV – 88  
IHD - 05

Modified from Thome et al<sup>72</sup>  
WHO = World Health Organization

**Table 7 Modified WHO classification of maternal cardiovascular risk: application**

Conditions in which pregnancy risk is WHO I
<ul style="list-style-type: none"> <li>Uncomplicated, small or mild                             <ul style="list-style-type: none"> <li>pulmonary stenosis</li> <li>patent ductus arteriosus</li> <li>mitral valve prolapse</li> </ul> </li> <li>Successful repair of congenital defect, postoperative drainage</li> <li>Atrial or ventricular septal defect</li> </ul>
Conditions in which pregnancy risk is WHO II
<ul style="list-style-type: none"> <li>Unoperated congenital aortic stenosis</li> <li>Repaired congenital aortic stenosis</li> <li>Most aortic regurgitation</li> </ul>
Conditions in which pregnancy risk is WHO III
<ul style="list-style-type: none"> <li>Mild left ventricular dysfunction</li> <li>Hypertrophic cardiomyopathy</li> <li>Native or tissue valvular heart disease not considered WHO I or IV</li> <li>Marfan syndrome without aortic dilatation</li> <li>Aorta &lt;45 mm in aortic disease associated with bicuspid aortic valve</li> <li>Repaired coarctation</li> </ul>

WHO III
<ul style="list-style-type: none"> <li>Mechanical valve</li> <li>Systemic right ventricle</li> <li>Fontan circulation</li> <li>Cyanotic heart disease (unrepaired)</li> </ul>
with bicuspid
HA III-IV)
impairment of
s
h bicuspid
<ul style="list-style-type: none"> <li>Native severe coarctation</li> </ul>

**Congenital 41 (36.3%) (16 ASD with PHT)**  
**Acquired – 72 (63.7%) (28 tight MS)**  
 Rheumatic – 58  
 IHD - 05  
 PPCM - 05  
 Cardiomyopathy (Other) – 04  
**Severe PH in 29**

Adapted from Thorne et al.<sup>73</sup>  
 LVEF = left ventricular ejection fraction; NYHA = New York Heart Association;  
 WHO = World Health Organization.

# Outcome of pregnancy

---

Outcome	Frequency	Percentage
Medical terminations	15	13.8
Miscarriages	2	1.8
IUFD	4	3.6
Live births	90	79.6
Neonatal Deaths	2	1.8
Total	113	100

# Gestation at Delivery

---

Gestation (weeks)	Frequency
<12	1
<24	1
24-36	30
37	23
Total	98

**53.5% Preterm deliveries**

# Mode of Delivery

---

Mode of Delivery	Frequency	Percentage
Spontaneous vaginal	9	9.5
Assisted vaginal Delivery	21	22.1
Intrapartum LSCS	12	12.6
Elective LSCS	54	55.8
Total	96	100

**68.4%**

# Three Maternal deaths – all had severe PH + comorbidity

---

1. Primigravida with double outlet single ventricle with severe PH with superimposed H<sub>1</sub>N<sub>1</sub> infection. Decided to continue despite advice to terminate in early pregnancy
2. Primigravida with large VSD with Eisenmenger's with severe PH and superimposed severe preeclampsia. Concealed the diagnosis of HD and the care provider missed the diagnosis
3. Primigravida with perimembranous VSD and severe PH with gestational hypertension and bronchial asthma. Delivered by CS at 33 weeks. Developed heart failure

# Conclusions

---

- With appropriate adjustments, mortality rates for severe heart disease could be brought down, even with limited resources
- We are making life-changing recommendations (e.g. terminations, sterilization etc.) without catheterization studies – is this correct?
- Managing severe heart disease in specialized centres will lead to improved outcomes

Thank you!!

---
